Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	27.03.2026
Team ID	69bf8031c1eab70902258949
Project Name	Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets
Maximum Marks	

1. Technology Stack: UI Policies

UI Policies are the primary client-side logic layer used to manage form behavior without writing code.

- **Execution Level:** Client-side (runs in the browser).
- **Trigger:** Executes when a form loads or when a specific field value changes.
- **Architecture Components:**
  - **Condition Builder:** A no-code interface used to define *when* a field should be mandatory (e.g., `State is Resolved`).
  - **UI Policy Actions:** The specific instructions tied to the policy that set field attributes: **Mandatory**, **Visible**, or **Read-only**.
  - **UI Type:** Can be set to "Desktop," "Mobile/Service Portal," or "All" to ensure cross-platform enforcement.

[!TIP]

Data Integrity Note: UI Policies only work on forms. To enforce mandatory fields during data imports or "list edits," you should pair them with **Data Policies**, which execute on the server side.

2. Technology Stack: Update Sets

Update Sets act as the "transport container" for moving configurations between ServiceNow instances (e.g., from **Development** to **Test** to **Production**).

- **Architecture Role:** Configuration Management and Deployment.
- **Tracked Changes:** Update sets automatically capture "metadata" changes, including:
  - Table definitions and Dictionary entries.
  - **UI Policies** and UI Policy Actions.
  - Client Scripts and Business Rules.
- **Non-Tracked Data:** They do **not** capture "transactional data" like specific Incident records, User records, or Tasks.

3. Implementation & Migration Workflow

The following table outlines the technical process of enforcing a field and migrating it:

Phase	Tool/Feature	Action
Preparation	**Update Set**	Create and "Set Selection" to a new Update Set (e.g., "v1.0 - Mandatory Field Logic").
Enforcement	**UI Policy**	Define conditions and add a **UI Policy Action** setting the field to `Mandatory = True`.
Validation	**Form View**	Test the form in the Dev instance to ensure the red asterisk appears and prevents submission when empty.
Closure	**Update Set**	Change the state of the Update Set from `In Progress` to `Complete`.
Migration	**Remote Instance**	"Preview" the Update Set in the Target instance to check for conflicts, then "Commit" to apply changes.

4. Architecture Summary

- **UI Layer:** Managed by **UI Policies** for immediate user feedback.
- **Database Layer:** Managed by **Data Policies** or **Dictionary Entries** for permanent enforcement.
- **Lifecycle Layer:** Managed by **Update Sets** to ensure environment parity and version control.
