User Acceptance Testing (UAT) Guide: UI Policies & Update Sets

This guide outlines the testing procedures to ensure that **UI Policies** correctly enforce mandatory fields and that those configurations migrate seamlessly between environments using **Update Sets**.

Phase 1: Validating UI Policy Logic

The goal here is to ensure the "Mandatory" requirement triggers only when it's supposed to.

Test Case	Description	Expected Result
Trigger Condition	Enter values that meet the UI Policy condition.	The target fields immediately become mandatory (indicated by a red asterisk).
Negative Condition	Change values so the condition is no longer met.	Mandatory requirement is lifted; the red asterisk disappears.
Form Submission	Attempt to save/submit the record with a mandatory field empty.	Form prevents submission and displays an error message (e.g., *"The following mandatory fields are not filled..."*).
Reverse if False	Ensure "Reverse if false" is checked in the policy.	If the condition becomes false, the field should return to its original state (non-mandatory).

Phase 2: Validating Migration (Update Sets)

Before moving to Production, you must verify that your "container" (the Update Set) captured every piece of the logic.

1. Preview and Commit

- **Previewing:** Check for **Commit Errors** or **Collisions**. If another admin modified the same UI Policy in the target environment, you must decide whether to "Accept Remote Update" or "Keep Local."

- **Committed State:** Ensure the status of the Update Set is **Committed** in the target instance (e.g., Test or QA).

2. Technical Checksum

- **Count Verification:** Ensure the number of "Customer Updates" in the Source instance matches the number of updates received in the Target instance.
- **UI Policy Action Check:** Often, the **UI Policy** moves, but the **UI Policy Actions** (the specific instructions to make a field mandatory) are missed if they weren't captured in the same set. Verify both are present.

Common Pitfalls to Watch For

The "Read-Only" Conflict: If a Data Policy or Access Control (ACL) makes a field read-only, the UI Policy might struggle to enforce "Mandatory" because the user cannot interact with the field. Always check for conflicting logic.

- **Order of Execution:** If multiple UI Policies affect the same field, the one with the **highest Order number** wins.
- **Global vs. View-Specific:** Ensure the UI Policy isn't restricted to a specific "View" (like *Mobile*) if you intend for it to work on the *Default* desktop view.

Summary Checklist for UAT Sign-off

- [ ] UI Policy triggers correctly based on defined conditions.
- [ ] Mandatory fields prevent form submission when empty.
- [ ] UI Policy remains active and functional after migrating via Update Set.
- [ ] No "Preview Errors" were ignored during the migration process.
